

Python: .py syntax
Jupyter: .ipynb

Variable: print("Raj")

declare & initialize a = "Raj" print(a)
↓ assignment

int → 4
V → 0
C → 1
F → 4
L → 8
d → 8

128
'a'
100
10.0
True
False

Room = "Raj"
Room = 'Vikas'
Room = 10

Room
Vikas
1000

id(Room) → 1000

① Col1 = "arya maing"
id(Col1) → Kulkas
Location

num = 10
num2 = 10
Value Address Same

② Col2 = "arya maing"
id(Col1) → 1000
id(Col2) → 1000

Value Same

Variable → num = 10 ← type Value
print(num) 1000 High level
print(id(num)) Address
print(type(num)) print(num, num)

num1 = 10
print(num1)
print(id(num1)) → 1000

Low code
↑ M/C
↓ USER

Middle
C, C++
so M/C
so USER

High
M/C → 10
↑ USER

Code file → Compiler
Line/Block → Interpreter

USER → C → M/C
I

Python Interpreter: num = 10
mutable change
immutable No change

num = 10
Room Name 1000
Room Name 2 1000

Common Immutable Types
int, float, bool, str, tuple
No change

Common Mutable Types
list, dict, set
change
[10, 20] → 30

Type Conversion

① string → Integer
int → float
implicit

② Kisan Effort Expend
implicit → No effort
Explicit → Effort
